Undefined ORF2 encoded by plasmid pAH4808. AAR41717 standard; Protein; 110 AA. 92WO-US10206. (first entry) 24-NOV-1992; 10-JUN-1993 

```
The sequences given in AAR41715-18 are encoded by the expression vector pAH4808. This vector represents the cloning of the human gamma isotype, gamma-4, with the variable region of the murine monoclonal antibody 128.1. This plasmid encodes a chimeric monoclonal antibody in which the heavy chain (VH) is derived from a murine source and the sequences encoding CHI, CH2 and CH3 are derived from a human source. This vector, in combination with the chimeric light chain vector. This vector, in combination with the chimeric light chain vector. PAG4611 (see also AAQ43845), was transfected into SP2/0 cells and clones were isolated. 128.1 is an anti-human transferrin receptor antibody which binds to the transferrin receptor on brain capillary endothelial cells. This antibody may be used in a conjugate in which it is linked to a neuropharmaceutical or diagnostic agent. The conjugate may be used to treat or prevent neurological disorders eg. brain tumours, AIDS, stroke, epilepsy, Parkinsons and Alzheimers disease. It may also be used for diagnostic methods.
Antibody conjugates specific for transferrin receptor - used for diagnosis and treatment of cancer, AIDS and neurological
                                                                                                             Disclosure; Fig 19J; 151pp; English.

New Fc region-containing polypeptides that have altered effector function due to one or more amino acid modifications in the Fc region, useful in the treatment of cancer and allergic conditions such as

Disclosure; Fig 22A; 132pp; English

```
produce Fc region-containing polypeptides that have altered effector.

Tunction as a consequence of one or more amino acid modifications in
the Fc region relating to the variant polypeptides that have altered effector
the Fc region. The variant polypeptides that nantile antibody),
and LFA-Inmediated disorders. Where the polypeptide binds the HER2
and LFA-Inmediated disorders. Where the polypeptide binds the HER2
receptor, the disorder preferably is HER2-expressing cancer, e.g. a
benign or malignant tumour characterized by overexpression of the
HER2 receptor. Such cancers include breast cancer, squamous cell
cancer, small-cell lung cancer, non-small cell lung cancer,
gastrointestinal cancer, pancreatic cancer, glioblastoma, cervical
cancer, ovarian cancer, pladder cancer, hepatoma, colon cancer,
colorectal cancer, endometrial carcinoma, salivary gland carcinoma,
kidney cancer, liver cancer, prostate cancer, vulval cancer, thyroid
cancer, hepatic carcinoma and various types of head and neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel fusion polypeptides comprising a peptide ligand domain which functions to target hybrid molecule to target cell, and immunoglobulin constant region multimerization domain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to non-naturally occurring peptide ligands which bind to the human erbB2 gene product ErbB2 (also known as HER2). Peptides represented in AAB7635 - AAB76420 and AAB76423 - AAB76509 are examples of the ErbB2 binding ligands of the invention. Sequences used in the ErbB2 binding ligands of the invention. Sequences used in the isolation of the peptides of the invention. The peptides compete for binding ErbB2 with naturally occurring ligands, and may be used to treat disorders characterized by over expression of HER2/ErbB2 such as cancers, system damage resulting from trauma, surgery, strokes, ischaemia, infection, metabolic disorders, nutritional deficiency or toxic agents. In particular the synthetic peptide ligands may be used to treat a netticular the synthetic peptide ligands may be used to treat in particular the synthetic peptide ligands may be used to treat. Albeimer's disease, parkinson's disease, epilepsy, multiple sclerosis, Huntington's chorea, Down's syndrome, nerve deafness, Meniere's disease.
                                                                                                           ó
                                                                                                                                                                                                                                                                                                                                                                                  Human; erbB2; HER2; cancer; nervous system disease; stroke; ischaemia; metabolic disorder; nutritional defliciency; Alzheimer's disease; Parkinson's disease; epilepsy; multiple sclerosis; Huntington's chorea; Down's syndrome; nerve deafness; Meniere's disease; diabetic neuropathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Non-naturally occurring peptide ligands which compete for binding human erB2 gene products, useful for treating e.g. Alzheimer's disease, multiple sclerosis and diabetic neuropathy -

This protein comprises an immunoglobulin (Ig) C-gamma-4 region.
The invention provides a method for the production of tumour-
specific Ig derived from a B-cell lymphoma patient. In the novel
method, expression plasmids containing the patient's VH region(s)
joined to either a C-gamma-3 (see AAT97188) or C-gamma-4 (see AAT97189)
sequence and expression plasmids containing the patient's VL
region(s) joined to either a C-kappa (see AAT97190) or C-lambda-2
(see AAT97191) sequence are cotransfected along with a selectable and
amplifiable marker into a cell line (e.g. BMS147.6.1.4), and
transfected cells are then subjected to selection and amplification.
The method permits the production of a multivalent vaccine which
reflects the degree of somatic variation found within the patient's
tumour. These novel multivalent vaccines provide superior vaccines
for the treatment of B-cell lymphoma.

The protein is used in the course of the invention. The specification describes cytokine antagonists comprising only the extracellular domain of the specificity-determining component of the cytokine receptor and the extracellular domain of a signal-transducing component of the cytokine receptor. The cytokine is an interleukin (IL-1, IL-2, IL-3, IL-4, IL-5 or IL-15), gamma-interferon or transforming growth factor-beta (IGF-beta). The antagonist is capable of binding the cytokine to form a nonfunctional and can also be used in assays for identifying novel agonists and

```
The invention concerns production of antagonists to any cytokine that utilizes an alpha specificity determining component, which when combined with the cytokine, binds to a first beta signal transducing component to software a non-functional intermediate which then binds to a second beta software intermediate which then binds to a second beta can be software so

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A fusion protein (AAR90921) consists of a human interleukin-4 (IL-4) mutant, IL-4.X124D, in which tyrosine at position 124 is replaced by aspartic acid, fused to the hinge-CH2-CH3 region of human 1964. It is the product of a gene fusion (AAR12659) constructed in vector pDB952. The fusion protein can be expressed in host cells, e.g. HeLa, and used as a soluble IL-4 and/or IL-13 antagonist to treat conditions caused by undesirable effects of these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New soluble protein antagonists of interleukin-4 and interleukin-13 - comprise IL-4 mutant fused to Ig constant domain, useful in treating e.g. allergy, autoimmune disease or chronic infection

The chimeric leptin, which has good pharmacological activity, combined with a prolonged clearance rate, can be used in the treatment or prophylaxis of obesity or associated conditions, e.g. atherosclerosis, hypertension and Type iI diabetes. It can also be used in cosmetic treatments for the improvement of body appearance, e.g. weight reduction treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Leptin; ob; obese; immunoglobulin G4; IgG4; hinge-CH2-CH3; fusion; chimeric; prolonged clearance rate; treatment; prophylaxis; obesity; atherosclerosis; hypertension; Type II diabetes; cosmetic; body appearance; weight reduction.

The IFN-beta molecule is joined at its C-terminal end through a peptide linker to the N-terminal end of the Ig gamma 4 chain Fc fragment, where the peptide linker comprises the sequence shown in AANI791. The hybrid recombinant protein is useful in the treatment of multiple sclerosis and viral hepatitis of the liver. The recombinant protein by incorporating the gamma 4 chain has an enhanced stability within the circulation thereby allowing the protein to be used for effective systemic therapy. The gamma 4 chain unlike the gamma 1 chain avoids problems such as complement fixation and antibody-dependent cell-mediated cytotoxicity. The present sequence reference of IEN-5, the peptide linker and an

Hybrid of interferon and immunoglobulin Fc linked via non-immunogenic peptide - is useful for treating e.g. hepatitis B or C, hairy cell leukaemia and multiple myeloma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           sequences, construction of an expression vector, and expression in mammalian cells. The linker is a T cell immunologically inert peptide that serves to eliminate the neo-antigenicity created by the joining of the two polypeptide moieties. It also helps to overcome steric hindrance from the Fc portion of the hybrid. The hybrid has a much longer in vivo half-life than native interferonally and will not penetrate undesired sites. It can be used to treat hepatitis B or C, hairy cell leukaemia, multiple myeloma or other cancers or viral diseases (claimed). It also serves as a model for the design and construction of other cytokine-Fc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                human interferon-alpha (FN-alpha) joined at its C-terminal end via a claimed linker peptide (see AAW18578) to the N-terminal end of human immunoglobulin heavy chain gamma-4 Fc. It is produced by PCR amplification (see AAW69921-24) of interferon-alpha and Fc
                                                                                                                                                                                                                                      Linker peptide; fusion protein; interferon-alpha; immunoglobulin; FC; cytokine; hepatitis B; hepatitis C; hairy cell leukaemia; multiple myeloma; camcer; viral disease; therapy.

These are encoded by the CDNA clones given in NAT61281 and AAT61280. HuDreg 55 can be used to prevent multiple organ failure associated with polytrauma and for the prevention of acute organ damage associated with extracorporeal blood circulation. The antibody inhibits interaction between the carbohydrate-recognising domain of the selectin and the corresponding cell surface receptor.

                                                                    Heavy chain (AAW14935) and light chain (AAW14936) sequences correspond to murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody 2A2 (see also AAW14931-32). They are encoded by a 2A2 human 1g64 expression plasmid insert (see also AAT62933). A chimeric antibody specific for porcine VCAM can be produced in transfected host cells. It is useful for diagnosing human rejection of porcine xenotransplants and for improving xenotransplantation of porcine cells, tissues and organs into human

Heavy chain (AAW14932) and light chain (AAW14931) sequences are provided for the murine anti-porcine soluble vascular cell adhesion molecule (VCAM) monoclonal antibody (MAAD) 2A2. Hybridoma 2A2 was produced by standard techniques using recombinant, soluble porcine produced by standard techniques using recombinant, soluble porcine (VCAM as immunogen. Chimeric antibodies can be produced by cloning expression plasmid pAPRX-3P modified to contain the human gamma (constant region in place of the human gamma! Cl region Sequences are provided for 2A2 (chimeric) human G2/64 conforce (AAW14934), and 2A2 human G2/64 expression plasmid insert product (AAW14934), and 2A2 chimeric antibodies are specific for porcine VCAM. They are useful for diagnosing kuman rejection of porcine xenotransplants and for inproving xenotransplantation of porcine cells; tissues and organs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antibodies binding to porcine but not human cell interaction proteins – useful to treat and assay for rejection of xenografted porcine organs, tissues or cells
                                                                                   Xenotransplantation; graft rejection; cell interaction; pig;
vascular cell adhesion molecule; VCAM; monoclonal antibody;
chimeric antibody; diagnosis.

Proc. Natl. Acad. Sci. U.S.A. 79:2633-2657(198).

- ALTERNATIVE PRODUCTS: CELL LINES PRODUCING IGG CONTAIN TWO MRNA SPECIES FOR IG GAMMA CHAINS. THE MAJOR SPECIES ENCODES SECRETED GAMMA CHAINS. A LESS ABUNDANT SPECIES APPEARS TO ENCODE MEMBRANE-BOUND CHAINS IN SEPARATE EXONS, THAT IS HOMOLOGOUS WITH THE MEMBRANE-BOUND SECHENT OF UT CHAINS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 APEFLGGPSVFLFPPKPRDTLMISRTPEVTCVVVDVSQEDPEVQFNWYVDGVEVHNAKTK 60
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    MISCELLANGOUS: THE SEQUENCE OF RESIDUES 1-329 IS ASSUMED TO BE IDENTICAL WITH THE CORRESPONDING REGION OF THE SECRETED FORM OF

C; Complex: An immunoglobulin heterotetramer subunit consists of two identical light (hain disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into C; Superfamily: immunoglobulin C region; immunoglobulin homology
C; Keywords: duplication; glycoprotein; heterotetramer; immunoglobulin
F; 20-85, Domain: immunoglobulin homology < IMI>
F; 99-110/Region: hinge
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A; Molecule type: DNA

I47162
Ig gamma 4 chain constant region - pig (fragment)
C;ppecies: Sus scrofa domestica (domestic pig)
C;pate: 21-Peb-1997 #sequence_revision 21-Feb-1997 #text_change 21-Jan-2000
C;Accession: I47162
R;Racskovics, II: Sun, J: Butler, J.E.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
